

Remindly Project - Knowledge Base & Interview Demonstration

Remindly is an AI-powered reminder and notification platform designed to help users manage tasks, schedules, and reminders efficiently through chat interaction. The system allows users to create reminders with a title, date, and specific time. Once the scheduled time is reached, the platform automatically sends a push notification to the user describing the task that needs to be completed.

1. Project Overview

The Remindly application is designed to simplify task scheduling and reminder management through a conversational chat interface. Users interact with the chatbot naturally to schedule tasks and receive real-time notifications. The platform focuses on productivity, automation, and user-friendly interaction.

2. Key Features

- Create reminders using chat interaction.
- Schedule reminders with title, date, and specific time.
- Receive push notifications automatically.
- Real-time reminder processing using asynchronous task execution.
- User-friendly conversational workflow.
- Support for embeddable chat widgets for customer interaction.

3. Technology Stack

Frontend: ReactJS, HTML, CSS

Backend: Django, Django REST Framework, GraphQL

Real-Time Communication: Django Channels (WebSockets)

Task Scheduling: Celery + RabbitMQ/Redis

Database: PostgreSQL / MongoDB

Deployment: Docker & Cloud-based infrastructure

4. Reminder Workflow

1. User opens the chat interface.
 2. User creates a reminder by entering a task title and scheduled time.
 3. The backend validates and stores the reminder in the database.
 4. Celery schedules the reminder task asynchronously.
 5. At the scheduled time, the system triggers a push notification.
 6. The user receives a reminder message describing the task.
-

5. Chat Interaction Demonstration

User	Hi Remindly, create a reminder for my project meeting tomorrow at 10:00 AM.
Bot	Sure! Your reminder 'Project Meeting' has been scheduled for tomorrow at 10:00 AM.
User	Set another reminder for submitting the report at 5:00 PM today.
Bot	Done! I will remind you to submit the report today at 5:00 PM.
System Notification	Reminder: Submit the report now.
System Notification	Reminder: Join your Project Meeting now.

6. Push Notification Example

Notification Title: Reminder Alert

Notification Message: "Your scheduled task 'Submit Report' is due now."

7. Interview Demonstration Points

- Explain how the chatbot simplifies reminder scheduling.
- Describe the asynchronous processing using Celery and RabbitMQ.
- Demonstrate real-time push notifications using WebSockets.
- Discuss scalability using Docker and cloud deployment.
- Highlight user-friendly conversational interaction.

8. Conclusion

Remindly demonstrates how conversational AI, asynchronous task processing, and real-time notification systems can work together to improve productivity and task management. The project showcases full-stack development skills, real-time communication, scalable backend architecture, and cloud-ready deployment.
